## Smart and innovative solutions to secure belongings

New ways of working, learning, exercising and relaxing create a need for new solutions to secure people's belongings. Vecos invents, develops and delivers those innovative and smart solutions since 1996: locker management solutions that comply with the latest requirements of safety, user-friendliness and management efficiency.

### Smart from the start

Vecos uses an electronic lock instead of a key or coin. Users request a locker on a touch screen and the system attributes them an available locker. The access right to a locker can be linked to a pin-code, a chip card, a magnetic card or a RFID pass.

### User-friendly and efficient

#### No key, no coin

The theft or loss of keys is cumbersome for the user, and certainly also for the administrator. The Vecos system offers carefreeness to the user while putting an end to the necessity to order and replace keys and locks for the administrator.

### Fit-for-purpose utilization

The locker enables the dynamic distribution of lockers. This means that lockers can but do not have to be attributed to particular individuals - Individuals can be attributed available lockers instead. What's more, a dual system can be installed.

### Efficient management

The administrator can log on any computer to manage the lockers, which also makes the attribution and distribution of keys obsolete.

### Optimized use of information

The Vecos system offers advanced reporting on the usage of lockers. In just a click, you can access an overview of which lockers are being used and how often.

### Universal applicability

The Vecos system can be fitted on virtually any type of locker supplied by your manufacturer. It can also be integrated with your existing access control system.

### Diverse applications

Be it a swimming pool, a school, a sports facility or a flexible workspace, the Vecos systems have already been implemented in diverse environments. We have also built extensive experience to support the increasing flexibility of workspaces at business and governmental offices.

## The characteristics of the Vecos Locker Management System (LMS):

### The electronic lock:

- Robust
- Alarm signal in case of break-in
- LED light when opening

### The central unit:

- Sleek stainless steel design
- Touch screen
- Multilingual
- Identification with pass or pin-code
- Support of all pass readers (MIFARE, 125kHz, magnetic strip, barcode)
- Infinite number of lockers on 1 system
- Functions stand-alone or in combination with the management system
- No data loss in case of power cut

### The management software:

- The management software is web-based
- SQL database and extensive reporting tool
- Unlimited number of terminals can be connected via TCP/IP
- Permanent and/or dynamic assignment of lockers (e.g. yearly, temporarily, rental basis)
- Language, authorizations and rights can be set up for each user/administrator
- Link with access control and card management systems, as well as student databases
- Link with payment terminals for commercial applications

### Safety and services:

- Emergency opening of lockers (in case of power cut or maintenance)
- Power back-up
- Professional installation and maintenance team
